

EventLevelManager Scene

Overview

This Unity scene implements a **branching narrative system** using a template-based approach. The player encounters **random events**, each offering **choices** that influence the story flow.

The system uses:

- **StoryBlock** – Represents a single point in the story with text and up to two options.
- **StoryEventTemplate** – Abstract base class for events. Each event implements its own `CreateBlocks()` and `LinkBlocks()` methods to define story progression.
- **EventLevelManager** – Scene manager that randomly selects an event and handles player choices via UI buttons.

Features

- Multiple **predefined story events**:
 - Lighthouse Event
 - Storm Event
 - Bad Food Event
 - Siren Song Event
 - Ghost Ship Event
 - Kraken Ripples Event
 - Message in a Bottle Event
 - Mermaid on the Rocks Event
- **Random event selection** at scene start.

- **Two-option branching** narrative per event.
- **Dynamic UI updates:**
 - `mainText` displays story content.
 - `option1` and `option2` display player choices.
 - Buttons only appear when options exist.

How to Use

1. Set up the UI:

- Add a **Text** object for `mainText`.
- Add **two Buttons** for `option1` and `option2`.
- Assign them to the `EventManager` script in the Inspector.

2. Start the Scene:

- The `EventManager` will randomly pick an event.
- Story text appears in `mainText`.
- Player can choose options with buttons.
- Choices lead to different story blocks.

3. Add More Events:

- Create a new class inheriting from `StoryEventTemplate`.
- Implement `CreateBlocks()` and `LinkBlocks()`.
- Add the new event to the `events` list in `EventManager`.
